CSA4312 – Internet Programming

Experiment - 2

Name: K. Dedeepya

Reg No:192324252

Aim:

To develop an online Hotel Room Booking System that allows users to check room availability, book and manage rooms, while administrators manage room details, prices, and bookings.

Procedure:

1. Create a responsive website using HTML and CSS with a home page, room details, About Us, Contact Us, customer service FAQs, travel guide, and privacy policy.

2. Develop registration and login forms that allow users to create accounts, log in, and view or modify their profile details.

3. Allow users to search for rooms based on dates and guest details, check room availability, view room types and prices, and book rooms by filling out a booking form.

4. Provide a user dashboard where customers can view their booking history and modify or cancel bookings at least three days before the arrival date.

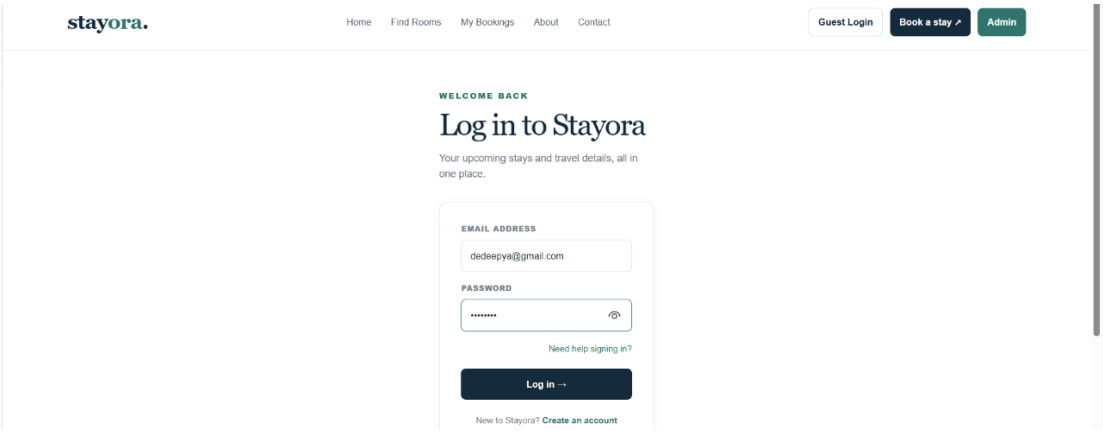

5. Create an admin panel that allows administrators to change the price and quantity of all four room types, update booking details, and cancel specific bookings when required.

6. Enable administrators to add or modify room information, contact details, customer service FAQs, local travel guides, and privacy policy information after logging in.

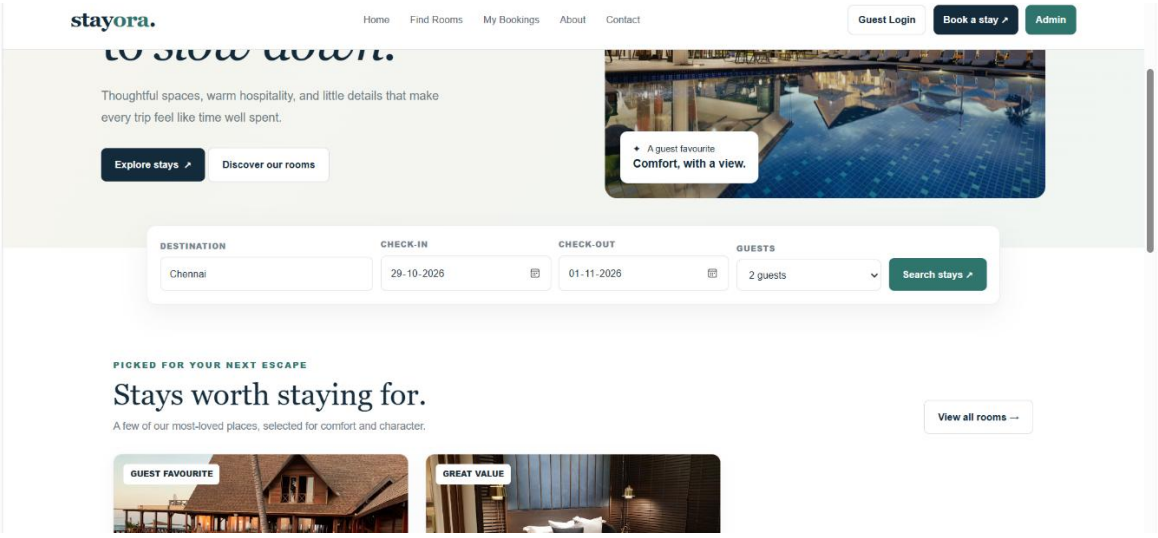

7. Display booking confirmation details after a successful reservation. Include payment gateway integration and confirmation emails if supported by the implementation.

8. Test user registration, login, room availability, booking, modification, cancellation, and administrator functions to ensure the website works correctly on desktop and mobile devices.
